JESLY PROSPER

jeslyprosper@gmail.com | linkedin.com/in/jeslyprosper | github.com/JeslyP | Portfolio: jeslyp.github.io/Jesly | London, UK |
British citizen (unrestricted right to work in the UK)

EDUCATION

BEng in Computer Science, 2:1 Honours **June 2026**
University of York, United Kingdom | Award mark 63. Accredited by the IET and BCS. Relevant coursework: Software & Systems Engineering, Object Oriented Data Structures & Algorithms, Operating Systems, Security & Networking, Machine Learning & Optimisation

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, Java, SQL
Back End & Web Services: REST API design, Next.js API routes, Flask, PostgreSQL, MS SQL Server, Supabase, authentication and input validation
Testing & Quality: Vitest, automated unit testing, test planning, code review, static type checking, debugging and troubleshooting, coding standards
Cloud & Delivery: GitHub Actions CI/CD, Vercel, AWS (Lambda, S3, EC2), Docker, Git, pull-request workflow, Agile (Jira)
AI-Assisted Development: Everyday use of Claude Code and GitHub Copilot for writing, debugging, and reviewing code
Languages Spoken: Fluent in English and Haitian Creole

EXPERIENCE

Software Developer, D&K Car Rentals LTD **June 2023 to September 2025**
Grand Turk, Turks and Caicos Islands | github.com/JeslyP/dk-car-rentals

- Designed, built, and solely maintained a full-stack booking, fleet, and financial reporting platform for a live business, including a REST back end of 20 API endpoints covering bookings, rentals, invoicing, payments, and reporting.
- Migrated the platform from Python/Flask and SQL Server to Next.js on Vercel with Supabase PostgreSQL, while the business kept running.
- Planned and wrote 159 automated tests across finance, rentals, authentication, validation, and uploads, run in a GitHub Actions pipeline with type checks and a production build before every release.
- Secured the service: every admin API route requires an authenticated session, every request body is validated on the server, and the privileged database key is never exposed to the browser.
- Provided all production support: troubleshot issues reported by the business, debugged them, and deployed fixes, while protecting financial records with reversible deletions and full backups.
- Gathered requirements from non-technical stakeholders, checked assumptions with them, and turned feedback into design changes and fixes.

Freelance Software Developer, Self-Employed **March 2020 to Present**
Grand Turk, Turks and Caicos Islands / remote

- Built web applications, back-end data pipelines, and reporting dashboards for multiple client businesses, integrating APIs, databases, and flat files into reliable systems.
- Implemented validation and error-handling frameworks so every client deliverable stayed accurate and consistent.

PROJECTS

Autonomous Multi-Robot System, Python, ROS2 and Docker (University of York) **January 2026**
github.com/JeslyP/AUROJES2025

- Designed an autonomous multi-robot system around an 8-state finite state machine, with Nav2 navigation, LiDAR obstacle avoidance, and automatic recovery when a robot became stuck.
- Wrote and ran a test plan of five scenarios, including sensor noise and a full-complexity stress test, each for 3 hours of simulation time, achieving 90 to 100% detection accuracy.

Campus Tycoon, Java Simulation Game (University of York) **December 2024**
github.com/JeslyP/CampusTycoonBackend2

- Built a libGDX simulation game in Java using the Factory pattern and inheritance and polymorphism across class hierarchies, working in a 4-person Agile team with Jira and CI/CD and delivering on time.
- Reviewed teammates' code through pull requests, checking it against the team's coding standards and design before merging.
- Diagnosed why the project's JUnit tests had never run (wrong source set), fixed an OpenGL initialisation bug they exposed, and added a GitHub Actions pipeline that builds and runs all tests on every push.

NHS Data Science & ETL Pipeline, Python and SQL (University of York) **May 2025**
github.com/JeslyP/NHS-Data-Science-Project-

- Normalised six raw NHS datasets (557k appointments) into a SQLite schema, then used logistic regression and K-means clustering, finding that 2% of patients make 15% of appointments while demographics did not predict cancellations.

CERTIFICATIONS

Cybersecurity Job Simulation, Mastercard (Forage) **Feb 2025**
The Legend of Python, Codédex **Feb 2025**
Introduction to Business Analysis, LinkedIn Learning (IIBA-accredited) **Aug 2026**
