British citizen (unrestricted right to work in the UK)

PROFILE

Computer Science graduate (2:1, University of York) and incoming Georgia Tech MS Analytics student, with two years' hands-on experience building and analysing real business systems: designed and ran the financial reporting, data infrastructure, and full-stack platform for a commercial car rental operation end to end. Strong Python, SQL, and JavaScript, applied machine learning across classification, clustering, and deep learning, and a track record of translating technical work into decisions stakeholders acted on. Certified in business analysis, financial planning, cybersecurity, and Python, with everyday use of AI tools. Available to start now, completing the MS alongside full-time work.

TECHNICAL SKILLS

Programming & Data: Python (Flask, Pandas, NumPy, Scikit-learn, PyTorch), Java, JavaScript/TypeScript (React, Next.js), SQL (T-SQL, PostgreSQL, MS SQL Server), Supabase
Machine Learning & Analytics: Predictive modelling (Logistic Regression), clustering (K-Means), deep learning (CNNs, PyTorch), statistical analysis, ETL pipeline design
Business & Financial Analysis: Financial reporting, revenue and cost analysis, KPI tracking, forecasting support, requirements gathering, business process mapping
Cloud & Engineering Practice: AWS (Lambda, S3, EC2), Docker, Snowflake, Git, CI/CD pipelines, REST API design, automated testing, Agile delivery (Jira)
Reporting & AI Tools: Tableau, advanced Excel (pivot tables, complex formulas), everyday use of AI tools (Claude, GitHub Copilot) for development and analysis
Languages: Fluent in English and Haitian Creole

EDUCATION

MS in Analytics (OMSA) Expected Winter 2027
Georgia Institute of Technology
BEng in Computer Science, 2:1 Honours June 2026
University of York, United Kingdom | Award mark 63. Accredited by the IET and BCS. Relevant coursework: Data Science & Machine Learning, Autonomous Robotics, Software & Systems Engineering, Object Oriented Data Structures & Algorithms

WORK EXPERIENCE

Software Developer, D&K Car Rentals LTD June 2023 to September 2025
Grand Turk, Turks and Caicos Islands | github.com/JeslyP/dk-car-rentals

- Designed, built, and solely maintained a full-stack booking, fleet, and financial reporting system (Python/Flask + SQL Server, later migrated to Next.js/Supabase) for a live commercial business.
- Analysed booking, revenue, and cost data to identify trends and inefficiencies, translating findings into recommendations that directly informed pricing and fleet decisions.
- Automated monthly financial reporting and recurring processes, replacing manual work and improving accuracy, consistency, and turnaround.
- Gathered requirements directly from non-technical stakeholders and delivered working solutions end to end, owning the system's full lifecycle from design to production support.

Freelance Software Developer, Self-Employed March 2020 to Present
Grand Turk, Turks and Caicos Islands / remote

- Built automated data pipelines, reporting dashboards, and web applications for multiple client businesses, integrating APIs, databases, and flat files into reliable systems.
- Implemented data validation and error-handling frameworks ensuring the accuracy and integrity of every client deliverable.

CERTIFICATIONS

Introduction to Business Analysis, LinkedIn Learning (IIBA-accredited)	Aug 2026
Financial Planning and Analysis (FP&A) Foundations, LinkedIn Learning	Aug 2026
CFI Corporate Finance Foundations Professional Certificate, LinkedIn Learning	Aug 2026
Cybersecurity Job Simulation, Mastercard (Forge)	Feb 2025
The Legend of Python, Codédex	Feb 2025

PROJECTS

Autonomous Robotics System (University of York) January 2026

github.com/JeslyP/AUROS2025

- Designed and implemented an autonomous multi-robot barrel-collection system for TurtleBot3 Waffle Pi robots in a Gazebo simulation, using Python and ROS2 within a Dockerised development environment.
- Built an 8-state finite state machine (searching, approaching, positioning, picking up, delivering, offloading, clearing space, decontaminating) to coordinate patrol navigation, target selection, pickup, delivery, and decontamination behaviours.
- Used the Nav2 stack for waypoint-based patrol navigation and LiDAR-based obstacle sectoring for real-time obstacle avoidance, combined with a proportional controller for visual servoing to align and approach detected targets.
- Implemented hysteresis-based target selection to prevent oscillation between similarly-sized detections, plus a timeout and escape manoeuvre to recover automatically when the robot became stuck.
- Designed and ran five distinct test scenarios (baseline, sensor noise robustness, varied item distribution via random seed, open environment, and a full-complexity stress test combining noise and obstacles), each run for 3 hours of simulation time, achieving 90 to 100% detection accuracy across scenarios.

NHS Data Science & ETL Pipeline (University of York) May 2025

github.com/JeslyP/NHS-Data-Science-Project-

- Designed a relational database schema from six raw NHS operational datasets (appointments, billing, insurance, prescriptions, surgery, test records), building an ER diagram and normalising the data into SQLite.
- Ran a chi-square test to identify significant drivers of appointment no-shows, built a logistic regression model to predict no-show likelihood (correctly identifying and flagging overfitting rather than reporting an inflated result), and applied K-means clustering to segment patients by behaviour.

CIFAR-10 Image Classification (University of York) May 2025

github.com/JeslyP/IMLOCW

- Built a CNN from scratch in PyTorch (three convolutional blocks with batch normalisation and dropout, trained with Adam and a scheduled learning rate over 20 epochs), achieving 81% test accuracy on a 40,000/10,000/10,000 train/validation/test split.

Campus Tycoon, Java Simulation Game (University of York) December 2024

github.com/JeslyP/CampusTycoonBackend2

- Built a libGDX-based city simulation game in Java, using the Factory pattern to instantiate building types and inheritance/polymorphism across building and event class hierarchies, coordinating a 4-person Agile team with Jira and delivering on time with CI/CD integration.
