JESLY PROSPER

jeslyprosper@gmail.com | linkedin.com/in/jeslyprosper | github.com/JeslyP | Portfolio: jeslyp.github.io/Jesly | London, UK |
British citizen (unrestricted right to work in the UK)

EDUCATION

BEng in Computer Science, 2:1 Honours **June 2026**
University of York, United Kingdom | Accredited by the IET and BCS. Relevant coursework: Software & Systems Engineering, Operating Systems, Security & Networking, Machine Learning & Optimisation, Object Oriented Data Structures & Algorithms

MS in Analytics (OMSA) **Expected Winter 2027**
Georgia Institute of Technology | Computational Data Analytics track

TECHNICAL SKILLS

Cloud & DevOps: AWS (Lambda, S3, EC2), Vercel, Supabase (PostgreSQL, Storage), Snowflake, Docker, GitHub Actions CI/CD, Git
Application Development: TypeScript, Next.js, React, Python, Flask, Java, REST API design, SQL, automated testing
AI & Data: PyTorch, Scikit-learn, Pandas, CNNs, classification and clustering, everyday use of AI tools (Claude, GitHub Copilot) in development
Architecture & Delivery: Solution design, platform migration, secure API design, requirements gathering, stakeholder communication, Agile (Jira)
Languages: Fluent in English and Haitian Creole

EXPERIENCE

Software Developer, D&K Car Rentals LTD **June 2023 to September 2025**
Grand Turk, Turks and Caicos Islands | github.com/JeslyP/dk-car-rentals

- Designed and solely delivered a full-stack cloud platform for a live car rental business: a public booking site with real-time availability, and an admin system for rentals, invoicing, payments, costs, and financial reporting.
- Led the migration from Python/Flask and SQL Server to Next.js on Vercel with Supabase PostgreSQL and Storage, while the business kept running.
- Built security into the architecture: every admin API route sits behind session authentication, the privileged database key is used only on the server, and file uploads go through a controlled endpoint with generated filenames.
- Set up a GitHub Actions pipeline that runs type checks, 159 automated tests, and a production build on every change before release.
- Worked directly with non-technical stakeholders to turn business needs into technical requirements, replacing paper log sheets and manual bookkeeping with automated workflows and a monthly profit and loss statement.
- Analysed booking, revenue, and cost data to identify trends and inefficiencies, turning findings into recommendations that informed pricing and fleet decisions.

Freelance Software Developer, Self-Employed **March 2020 to Present**
Grand Turk, Turks and Caicos Islands / remote

- Designed and built web applications, automated data pipelines, and reporting dashboards for multiple client businesses, integrating APIs, databases, and flat files into reliable systems.
- Gathered requirements from each client and implemented validation and error-handling to keep every deliverable accurate and consistent.

PROJECTS

Autonomous Multi-Robot System, Python, ROS2 and Docker (University of York) **January 2026**
github.com/JeslyP/AUROJES2025

- Architected an autonomous multi-robot barrel-collection system for TurtleBot3 robots in Gazebo, inside a Dockerised development environment, coordinated by an 8-state finite state machine.
- Combined Nav2 navigation, LiDAR obstacle avoidance, and visual servoing, with automatic recovery when a robot became stuck.
- Validated the system across five test scenarios, including sensor noise and a full-complexity stress test, each run for 3 hours of simulation time, achieving 90 to 100% detection accuracy.

CIFAR-10 Image Classification, PyTorch (University of York) **May 2025**
github.com/JeslyP/IMLOCW

- Built a CNN from scratch with batch normalisation and dropout, trained with Adam and a scheduled learning rate, achieving 81% test accuracy.

NHS Data Science & ETL Pipeline, Python and SQL (University of York) **May 2025**
github.com/JeslyP/NHS-Data-Science-Project-

- Normalised six raw NHS datasets into a relational schema, then used logistic regression and K-means clustering to predict and segment appointment no-shows.

Campus Tycoon, Java Simulation Game (University of York) **December 2024**
github.com/JeslyP/CampusTycoonBackend2

- Built a libGDX simulation game using the Factory pattern and class hierarchies, coordinating a 4-person Agile team with Jira and CI/CD.

CERTIFICATIONS

Mastercard Cybersecurity Job Simulation (Forage) **Feb 2025**
Salesforce Essential Training, LinkedIn Learning **Oct 2026**
Introduction to Business Analysis, LinkedIn Learning (IIBA-accredited) **Aug 2026**
The Legend of Python, Codédex **Feb 2025**
